FAQ: What is Project Management Software?

Project management software is used to plan, schedule, track, collaborate and report on projects. More specifically, these essential tools project managers, teams, and other contributors complete tasks; record and track requirements; streamline resources; and manage time, budget, and scope constraints. Whether used as a stand-alone tool or as a suite of solutions, project management software — often shortened to PM software — is a must for any organization looking to maximize time and money while minimizing human error.

Implementing the Right Project Management Software for Your Business

Companies should carefully plan how they roll out new project management software. The responsible project manager will need to first get the support of major stakeholders—from C-level executives to end users on the project team. From there, project managers should create a schedule that allocates time for learning how to use the software before taking on a major project. That way, each and every project will be set up properly.

Finally, be ready with training materials, support documentation, and (ideally) onboarding teams to ensure individuals don't have to spend too much time learning about these project management programs and can quickly pivot back to their normal workloads.

What Are the Most Important Features of Project Management Software?

Choosing the right features for your team will depend on the size of your team, the complexity of the projects you run, and the project types and use cases you work with. Prospective PM software buyers should look for the following features:

- **Task Management:** Create, update, and manage task progress along a project's timeline.
- **Scheduling:** Establish due dates, create dependencies, and track every action.

- **Team Collaboration:** Facilitate frictionless communication within the PM tool environment.
- **Document Management:** Break down silos between teams and their document stacks.
- **Email and Chat Integration:** Communicate with the tools your teams are already using.
- **Reporting:** Keep stakeholders updated on project progress, challenges, and wins.
- **Time Tracking:** Know how your team's most valuable resource is being spent.
- **Project Portfolio Management:** Track the dynamics of multiple related projects concurrently.
- **Mobile Apps:** Stay on top of the work from any screen.
- **Third-Party Integrations or API:** Connect your PM solution to your other mission-critical systems.
- **White Labelling, Branding, and Custom Settings:** Customize your team's PM environment
